

## ATTACHMENT A

### Abstract Of The Disclosure

The invention concerns a compound corresponding to general formula (1) wherein, in particular, R<sub>2</sub> represents a phenylmethyl or naphthylmethyl or cyclohexylmethyl radical, 2- and 3-pryidinylmethyl, substituted on the cycle in meta or para position by an acid group or an alkyl radical of the type (CH<sub>2</sub>)<sub>n</sub> (with n = 3 or 4) substituted in terminal position by an acid group; and R<sub>3</sub> represents a hydrogen group or a linear or branched C<sub>1</sub>-C<sub>4</sub> alkyl or alkylcycloalkyl with a C<sub>3</sub>-C<sub>6</sub> cycloalkyl. The invention also concerns the use of a compound of general formula (I) for preparing a pharmaceutical composition for treating diseases related to proliferative processes, cancers and/or metastases.
